IN THE ABSTRACT:

On page 42, please replace the title and Abstract starting on line 1, with the following new title and Abstract:

A MIRROR ASSEMBLY SECURITY SYSTEM

ABSTRACT OF THE DISCLOSURE

A mirror assembly security system suitable for use in a vehicle comprises an exterior mirror assembly including a reflective element and a positioning device for adjustably positioning said reflective element. A light module is positioned substantially within the assembly and includes an enclosure having a light-transmitting opening generally facing downward when the exterior mirror assembly is mounted to a side of the vehicle. The light module includes a light source and a light-directing surface at least partially surrounding the light source. The light module projects a pattern of light from a bottom portion of the assembly to illuminate a ground area adjacent the vehicle in order to create a lighted security zone when said light source is electrically powered.

EXTERIOR VEHICLE SECURITY LIGHT

ABSTRACT OF THE DISCLOSURE

~~A mirror assembly security system for a vehicle includes an exterior mirror assembly and a light module removably positioned within the exterior mirror housing. The light module is moisture impervious and includes an enclosure, a light emitting opening in the enclosure, a light source in the enclosure radiating light through the light emitting opening, and a cover for the light emitting opening adapted to direct the light from the light source to an area adjacent the vehicle to create a security area. The light source may be supported by a pair of electrical contacts provided on the inner surface of the enclosure. The enclosure wall supporting the electrical contacts is preferably flexible, in order to allow the light source to be captured by the contacts. Attachment of the cover adds rigidity to the enclosure to prevent further flexure of the enclosure wall in order to firmly retain the light source. The enclosure is preferably configured so that the same unit can be installed in both left and right handed exterior mirror assemblies even though the light module generates a non-symmetrical light pattern. A reflective surface is provided in the enclosure which cooperates with the cover to produce a generally collimated light pattern.~~
